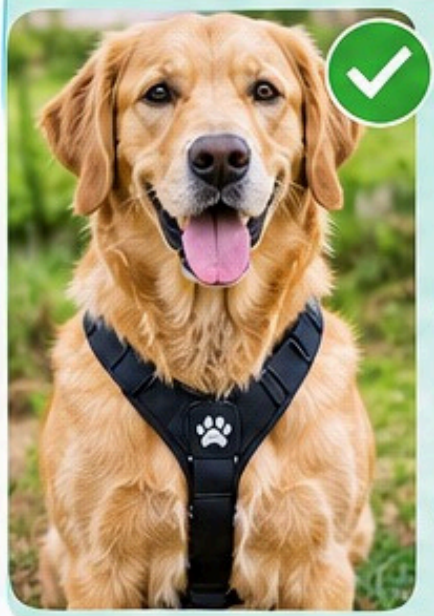
Harnesses

The right fit. The right design.

Restricted Harness (not recommended)

- A bar across the front restricts shoulder movement.
- Can interfere with natural gait, may cause discomfort, and can increase risk of injury.
- Especially avoid this style for puppies.

Y-Front, Balanced Harness (our preferred choice)



- Y-front design allows free movement of the front legs.
- A balanced harness distributes pressure without restricting shoulder movement.
- Supports healthy movement, now and as they grow.

Rear Clip vs Front Clip

Rear Clip

- Clip on the back.
- Allows the dog to put their full body body weight into pulling.

Front Clip

- Clip on the chest.
- Turns the dog away from where they're pulling, discouraging pulling – if you keep moving forward.

Key Takeaway

Choose a Y-front, balanced harness and avoid restrictive styles, especially for puppies.

Equipment helps us manage the dog...
...training teaches them how to walk with us.
